

Build the complete Take my money project from scratch in this repository.

Read SPEC.md completely before making any changes. Treat every P0 requirement, acceptance criterion, financial invariant, security boundary, and definition-of-done item as mandatory.

Before implementing application code:

1. Create the required AGENTS.md from the specification.
2. Create docs/EXECUTION_PLAN.md as a live milestone checklist.
3. Create docs/DEPENDENCIES.md and record the exact package versions you select.
4. Initialize Git and create the first commit.
5. Inspect the current official OpenAI documentation for GPT-5.6, the Responses API, image input, Structured Outputs, reasoning settings, safety identifiers, and the JavaScript SDK.

Then implement the project milestone by milestone in the order defined in SPEC.md.

Do not reduce the project to a static prototype or a proration calculator. Build the complete working subscription-portability sandbox, including:

- synthetic receipt image processing with GPT-5.6;
- Zod-backed Structured Outputs;
- authoritative sandbox provider verification;
- framework-independent deterministic billing core;
- bigint minor-unit monetary arithmetic;
- exact UTC-duration proration;
- versioned credit policy;
- eligibility and risk engine;
- immutable expiring quotes;
- idempotent confirmation;
- concurrency protection;
- saga-style target subscription creation;
- unknown-result reconciliation;
- one-time source consumption;
- append-only credit ledger;
- append-only audit trail;
- consumer flow;
- technical system view;
- AI fallback;
- unit, integration, concurrency, and Playwright tests;
- production deployment configuration;
- complete English documentation.

Never use GPT-5.6 for arithmetic, financial eligibility, state transitions, credit authorization, or transaction execution. GPT-5.6 may extract unverified evidence and explain already verified deterministic facts only.

Do not call real Apple, OpenAI billing, Stripe, or payment APIs. Do not collect real credentials, receipts, or payment information. Do not claim that the sandbox performs a real refund, cancellation, charge, subscription transfer, or ChatGPT plan change.

After every milestone, run the required checks and fix all failures before proceeding. Do not leave placeholder controls, fake success states, dead routes, unresolved TODOs, broken responsive layouts, or undocumented substitutions.

The project is complete only when every P0 acceptance criterion in SPEC.md is satisfied, the full test suite passes, the production build succeeds, and the complete flow works from a clean browser session.
